

The gammaCore device is a non-invasive, handheld device that is used to treat migraine headaches and cluster headaches. It uses a technique called vagus nerve stimulation (VNS) to help relieve pain and prevent headaches from occurring.

The vagus nerve is a long nerve that runs from the brainstem to the abdomen, and it is involved in regulating many bodily functions, including heart rate, digestion, and inflammation.

By stimulating the vagus nerve, the gammaCore device can help to reduce pain and inflammation, and prevent migraines and cluster headaches from occurring.

The device is simple to use and can be easily operated by patients at home. It consists of a small, handheld unit that is placed against the neck, and delivers a mild electrical stimulation to the vagus nerve. The device is designed to be used for a few minutes each day, either as a preventative measure, or to help relieve pain during an acute migraine or cluster headache attack.

The gammaCore device is a safe and potentially effective treatment option for patients with migraine headaches and cluster headaches. It is well-tolerated by most patients, with few side effects.

If you are interested in using the gammaCore device for the treatment of your migraines or cluster headaches, talk to your consultant to see if it is a good option for you. They can provide you with more information about how the device works, and how to use it properly to achieve the best possible results.
